

# UltraScience Net: Overview, R&D, Status

JET-Net Half-Day Workshop

April 19, 2005

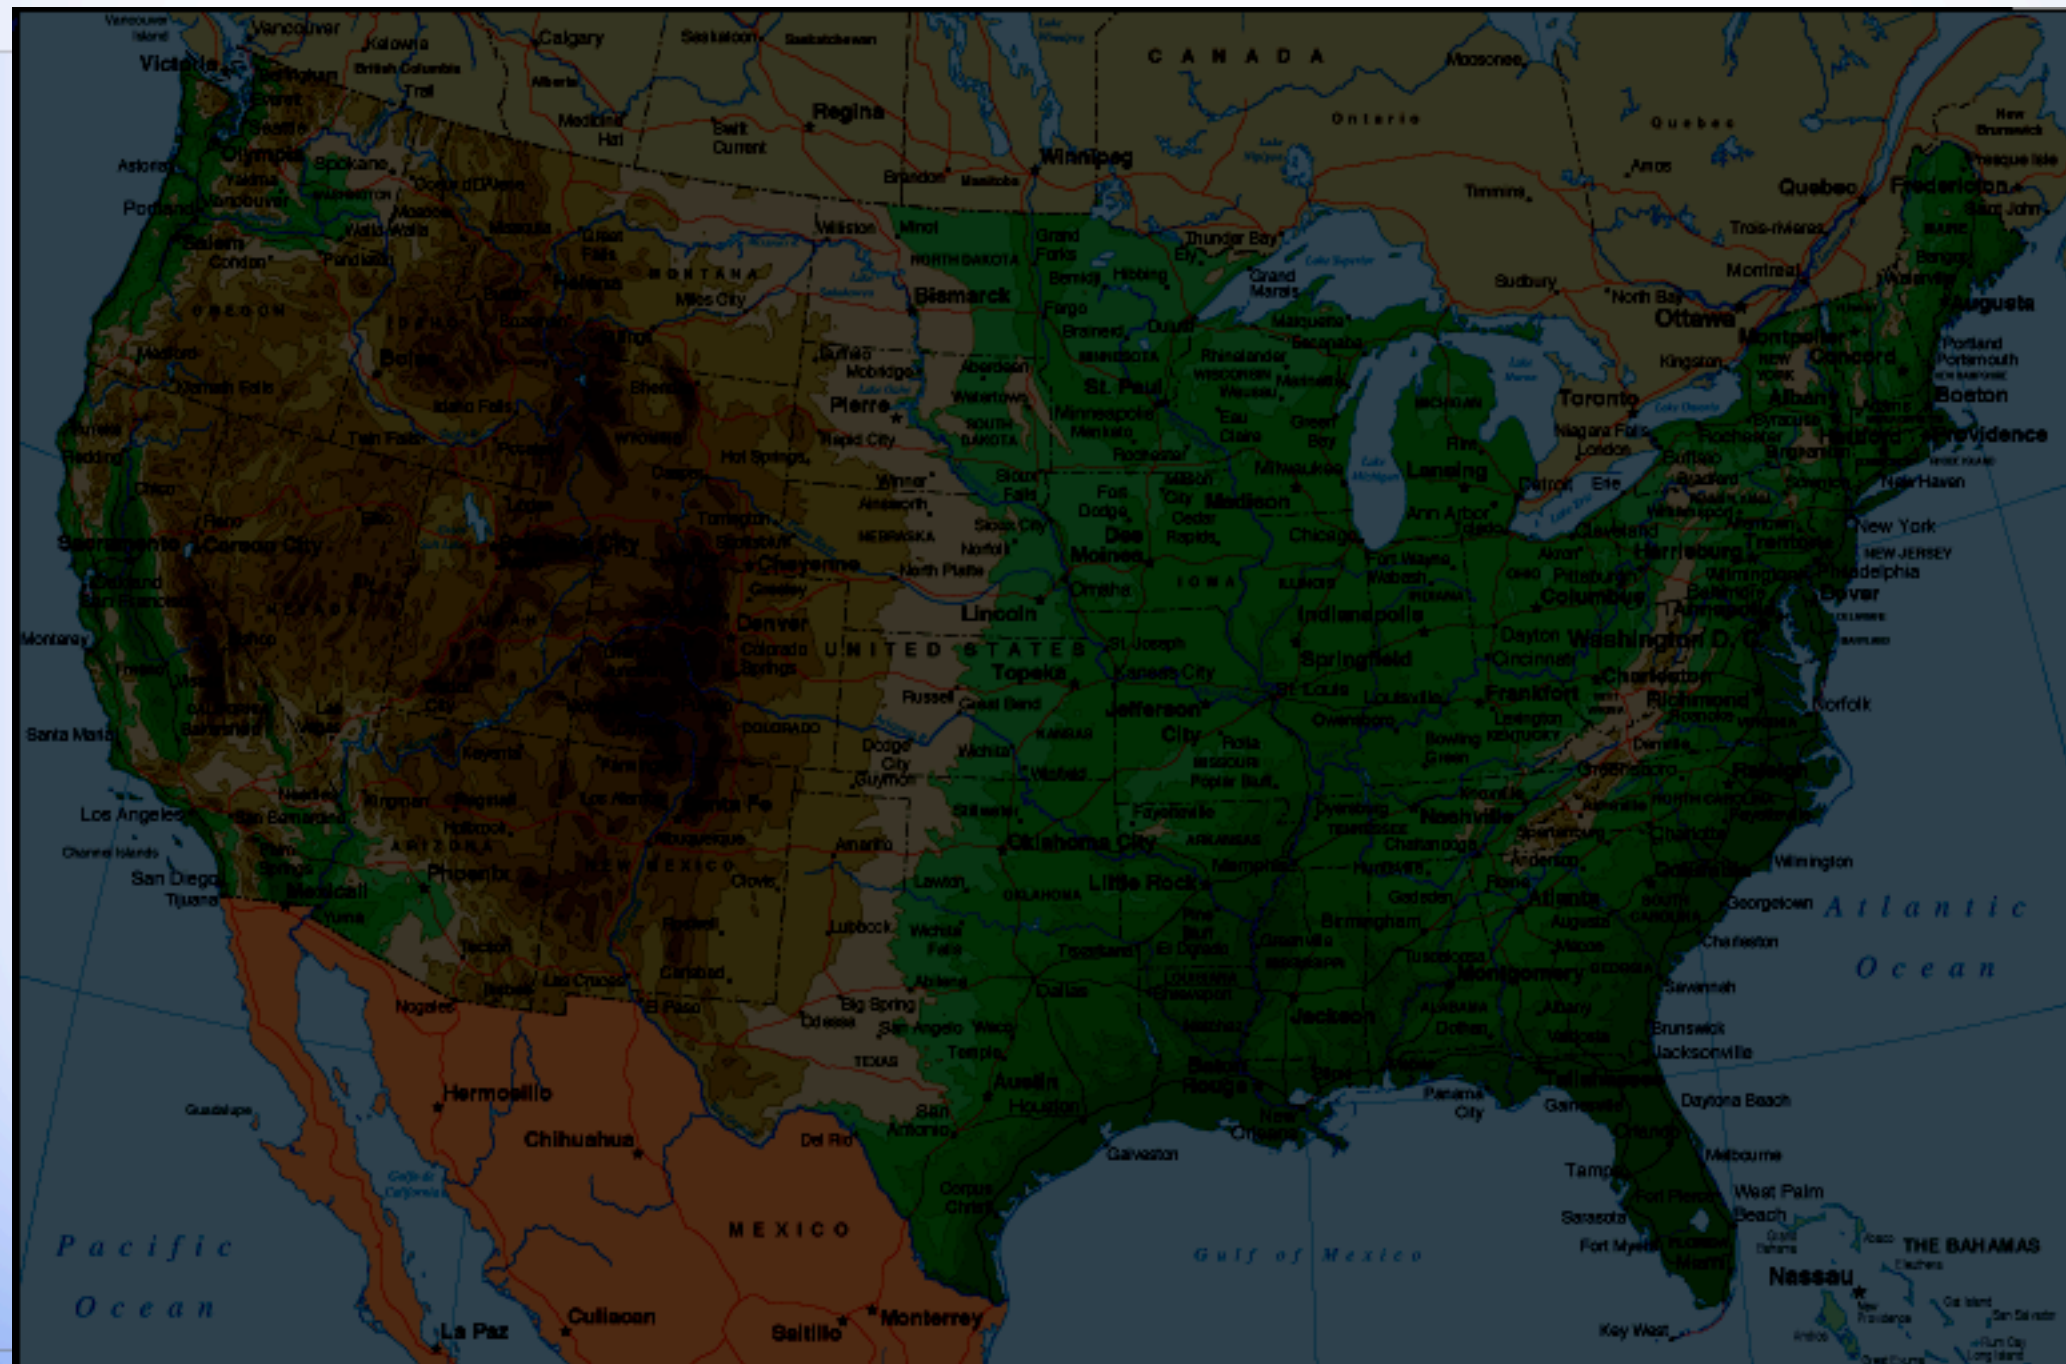

W. R. Wing/N. S. Rao

# Outline -

---

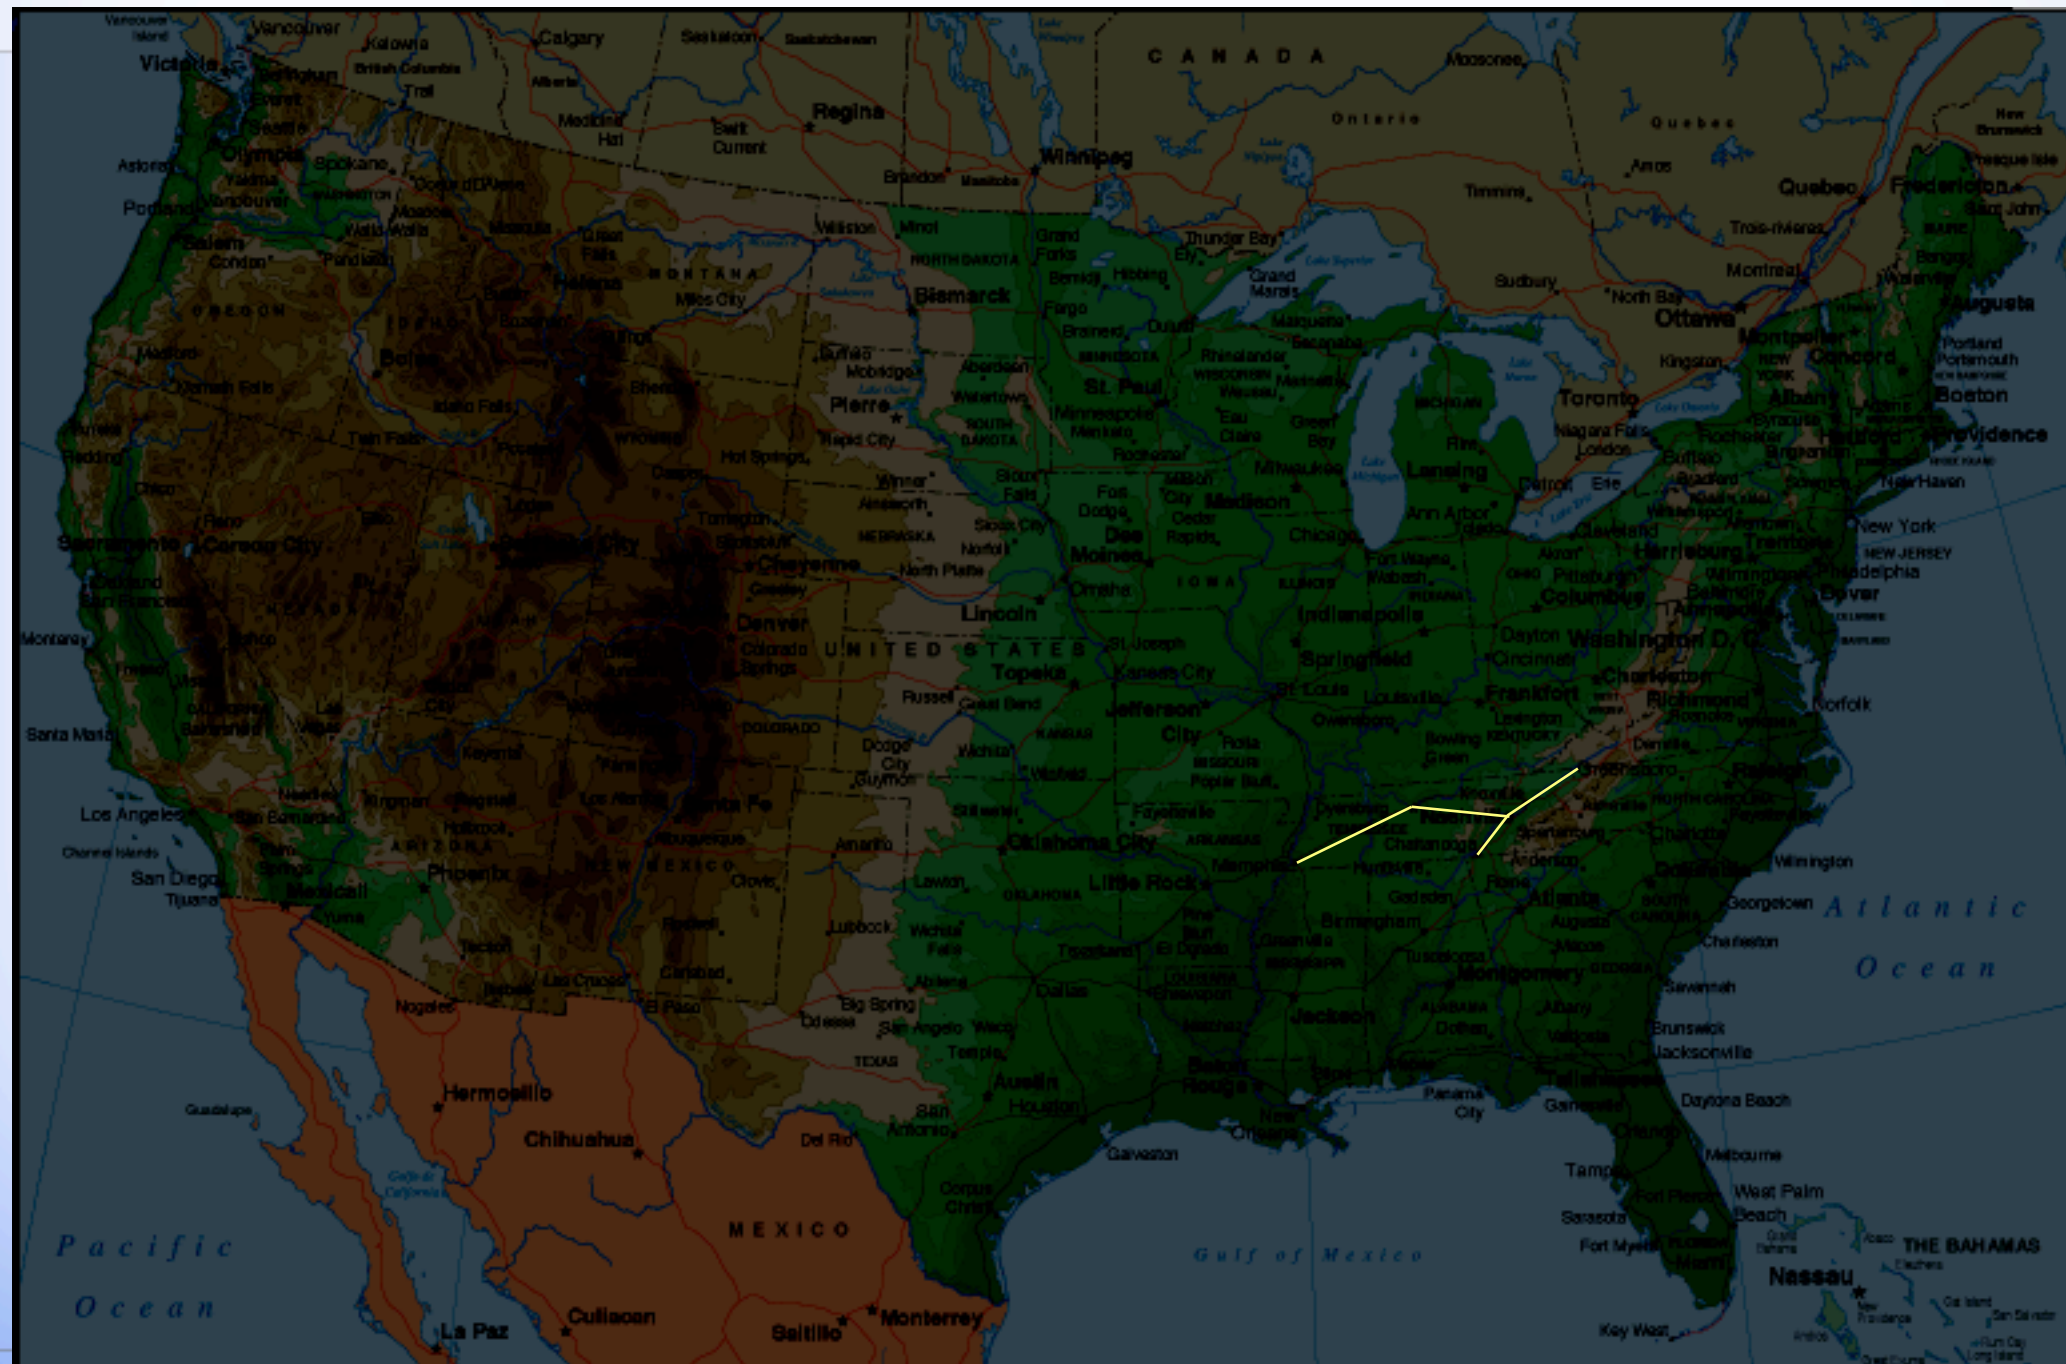

- Quick Review
  - What we're doing
  - Why
  - Vision for the future
- Status
  - Atlanta - Chicago
  - Knoxville - Nashville
  - UltraScience Net

What are we doing? We're building a network.  
We started with a blank slate...

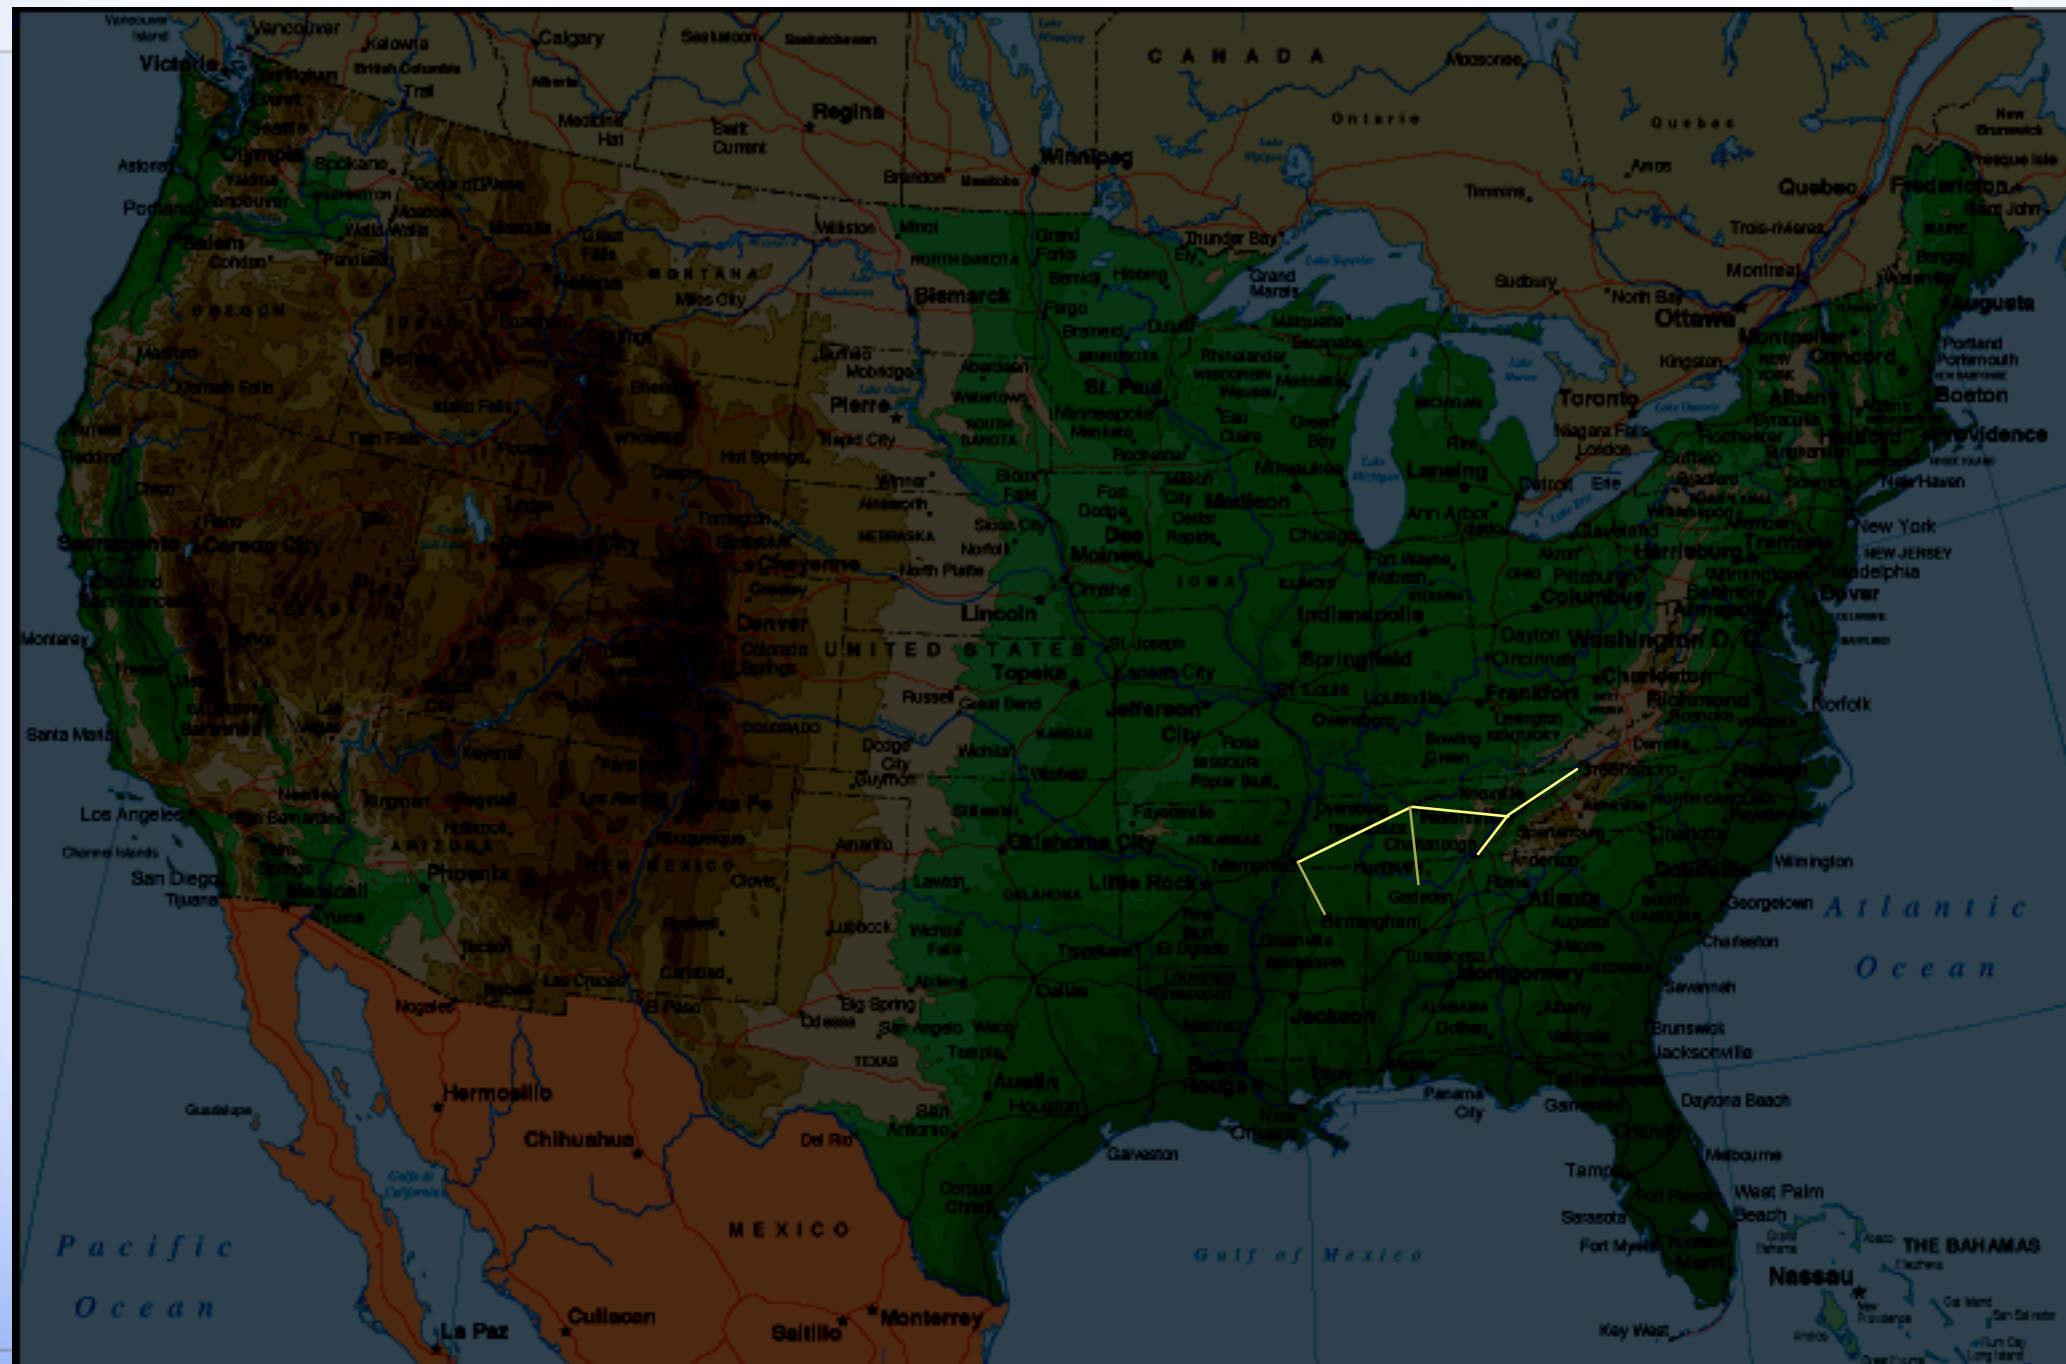

# IRU with TVA: Chattanooga to Tri-Cities and Knoxville to Nashville to Memphis

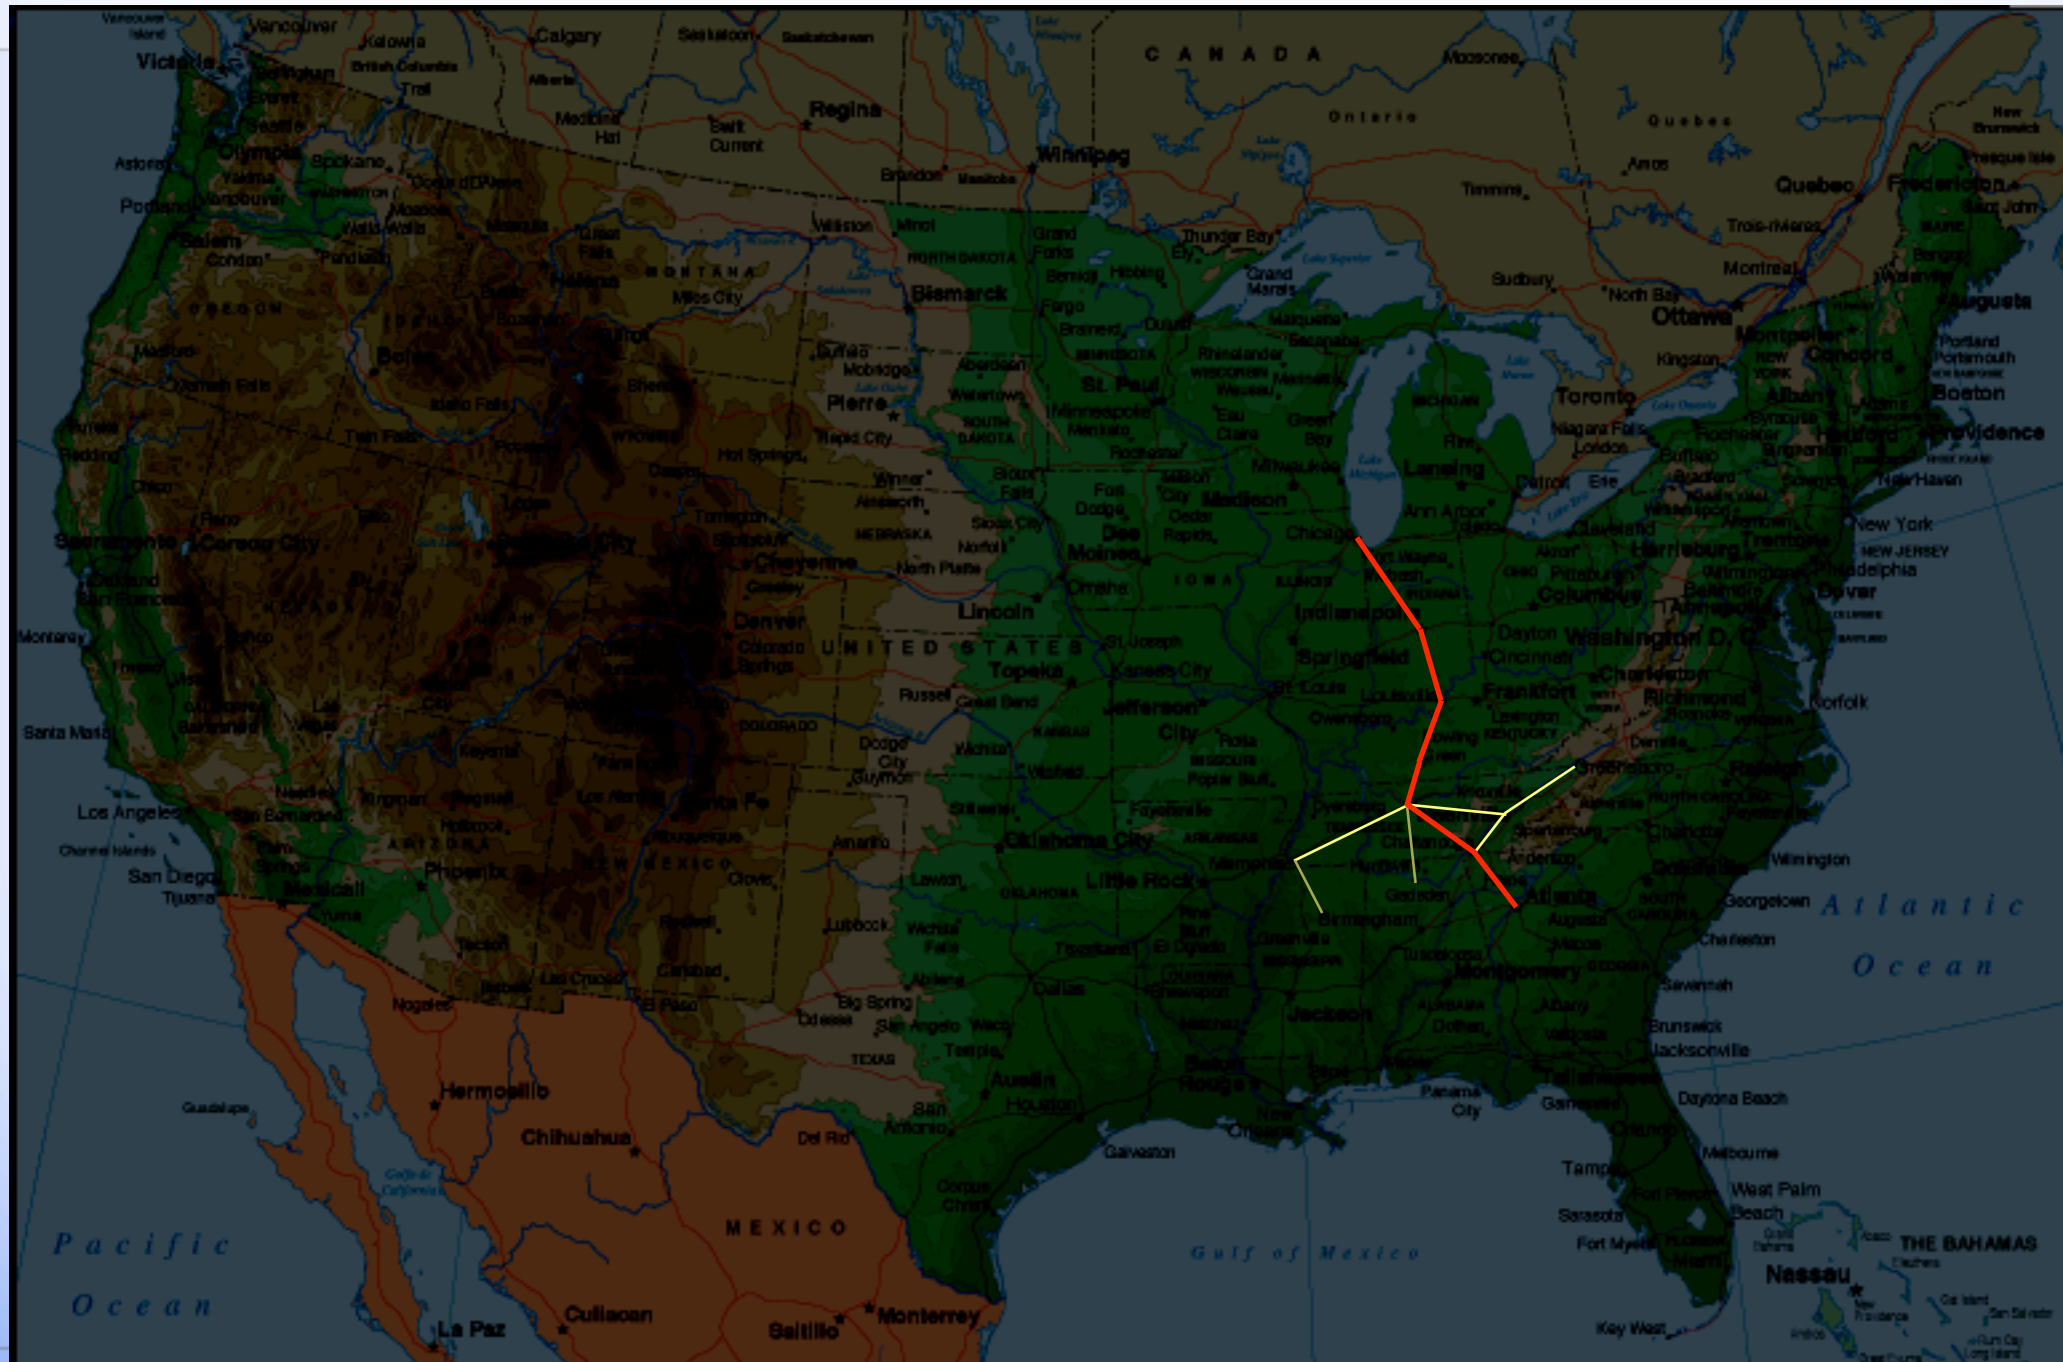

# With stubs into Alabama and Mississippi

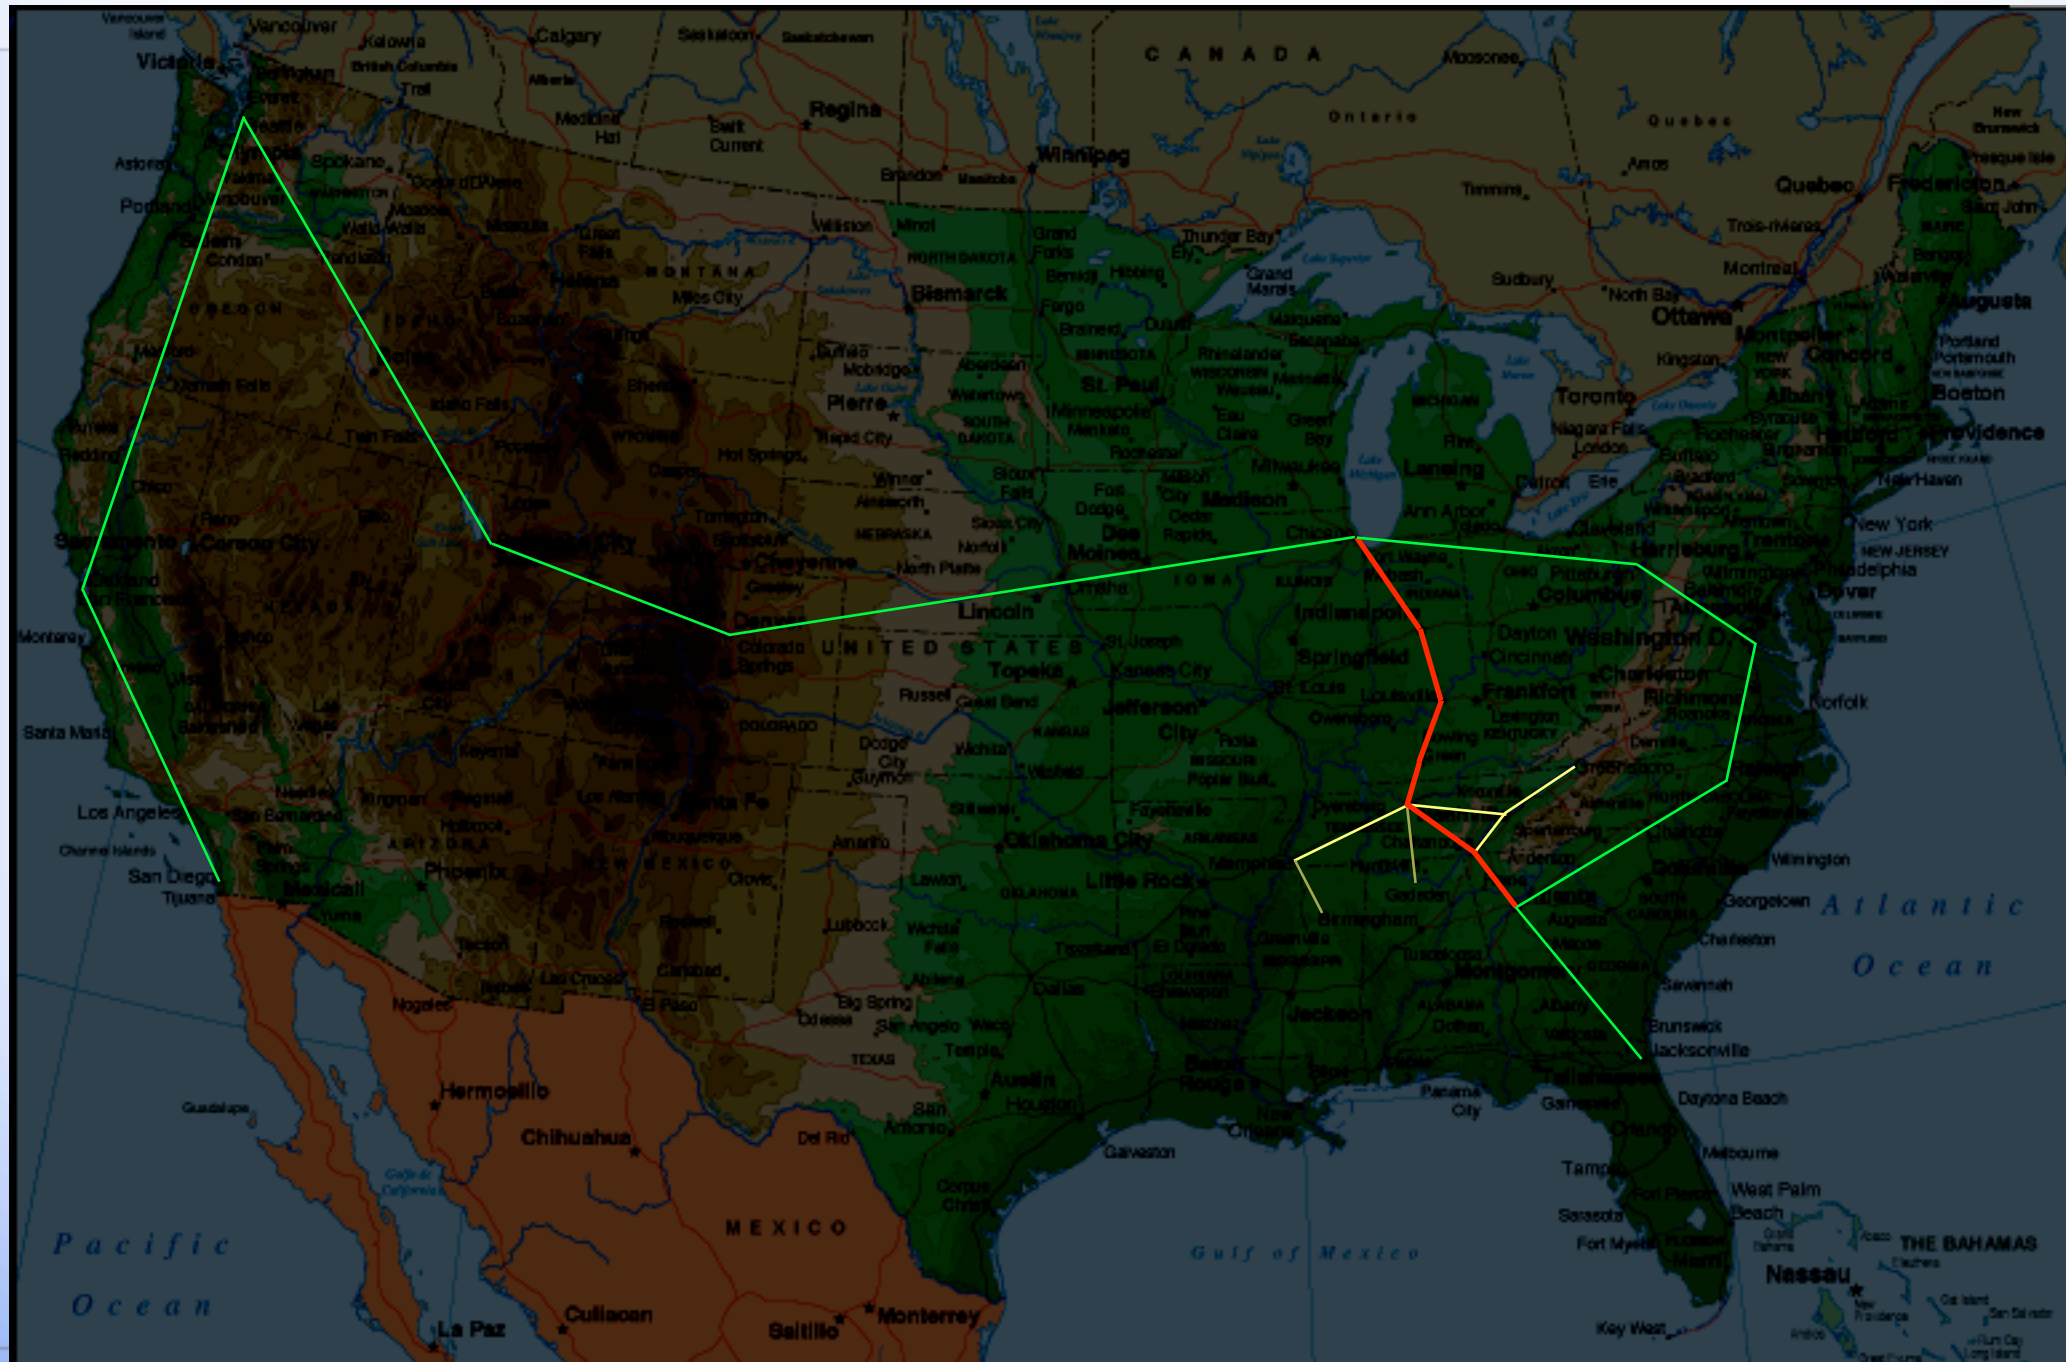

# Another IRU with Qwest: Atlanta - Chicago

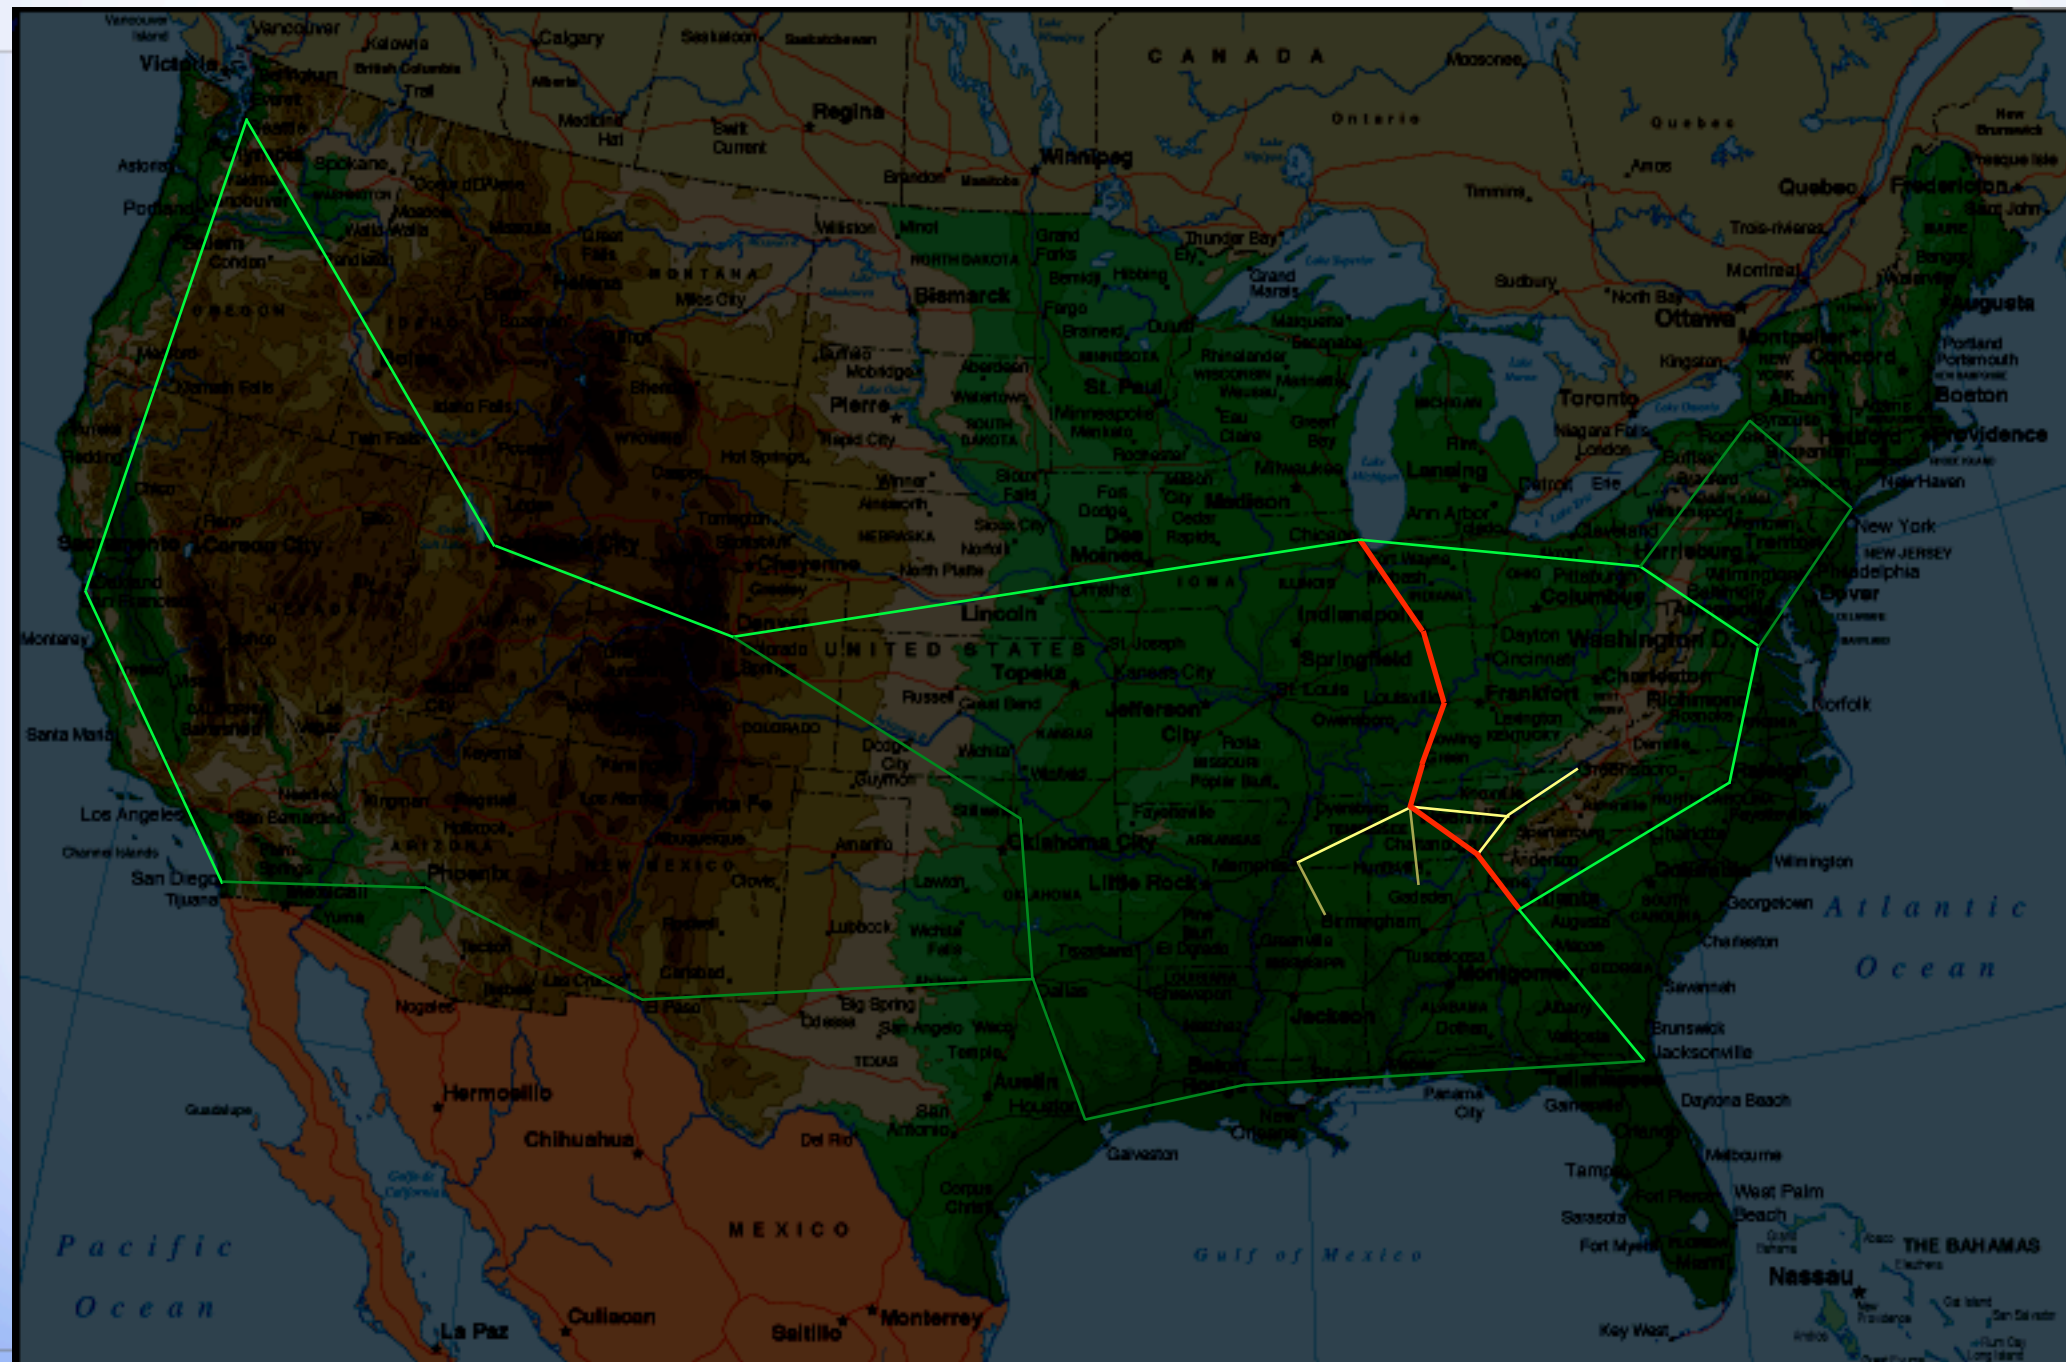

# Arranged asset trade with NLR

## Charter-member prices on their infrastructure

# Which will look like this when finished

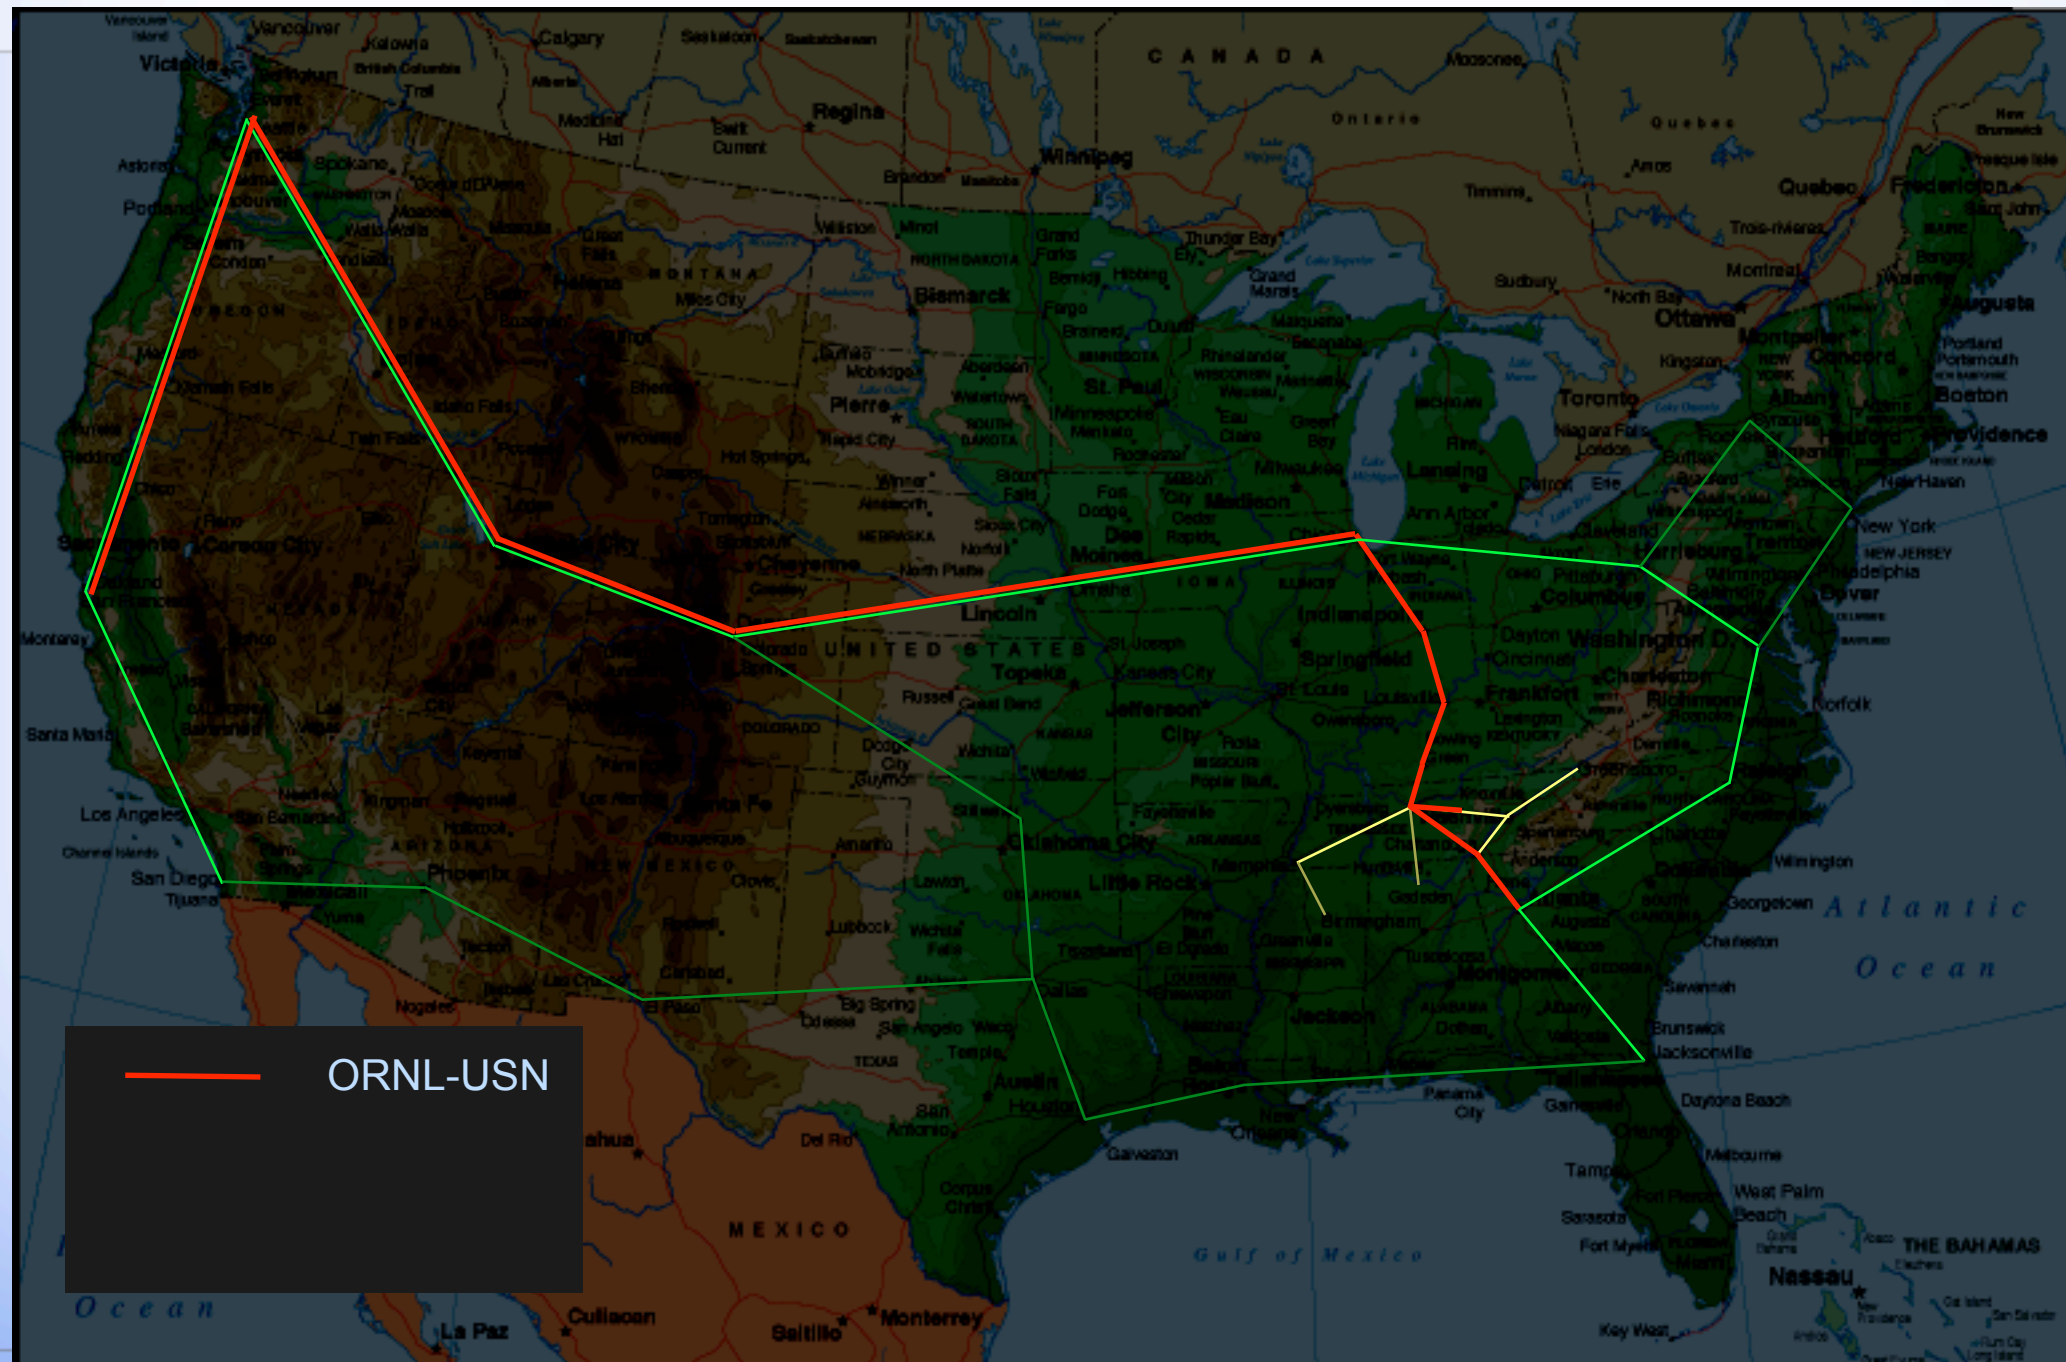

# Infrastructure - Not a Network

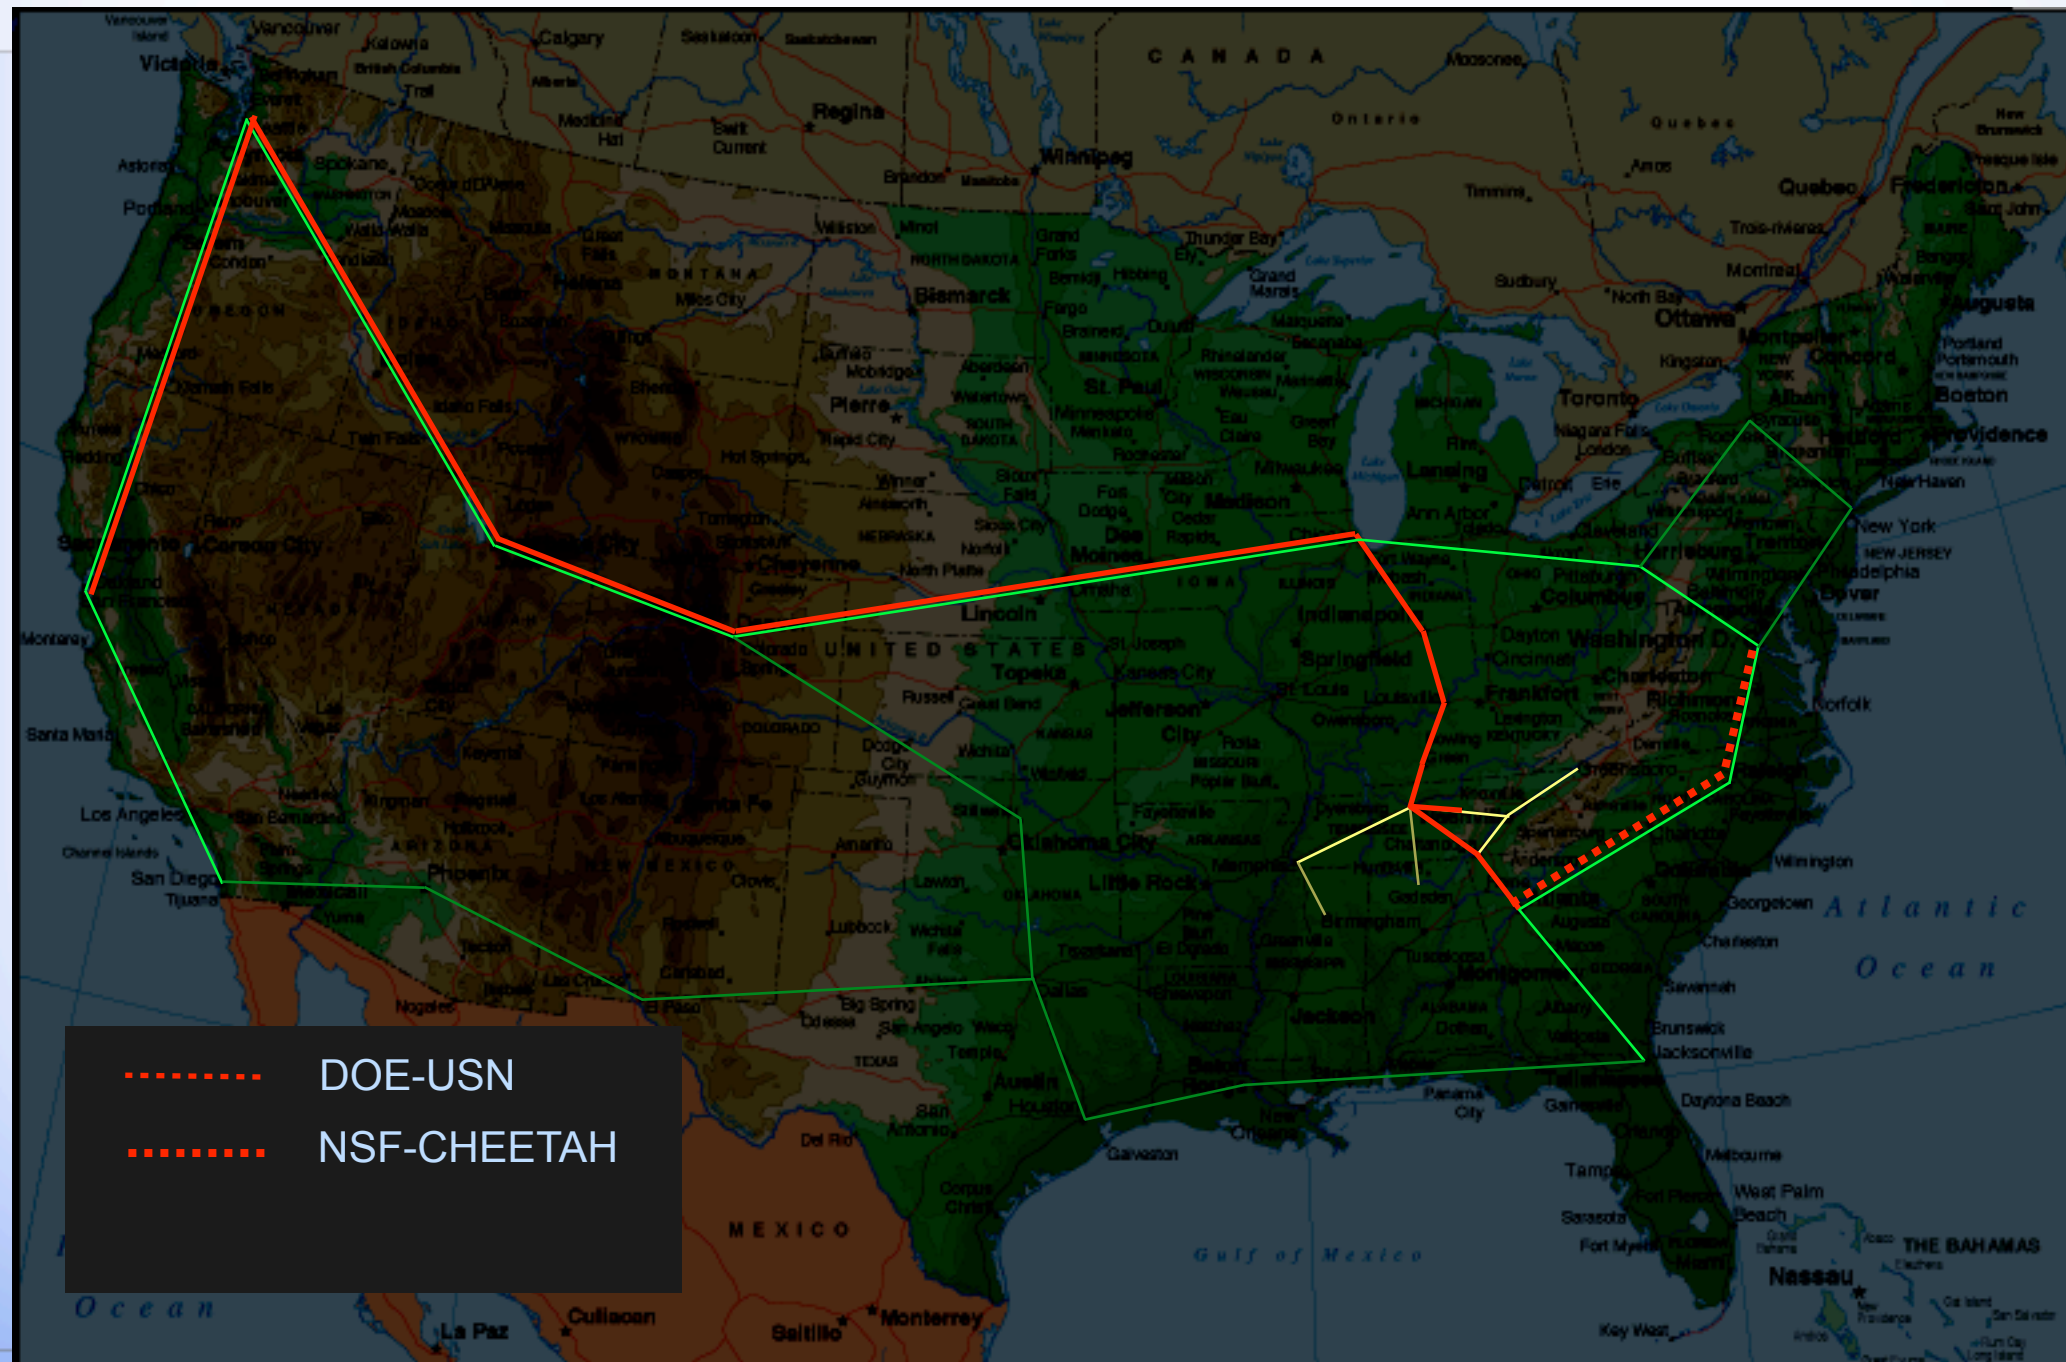

- On it, we're building or adding to three research networks
  - DOE's UltraScience Network
  - NSF's CHEETAH (which will help us study inter-domain issues in switched circuits)
  - ORNL's connection to DOE's ESnet (which will bridge to operational status for Switched-Circuit techniques)

# UltraScience Net: a reservation-based network

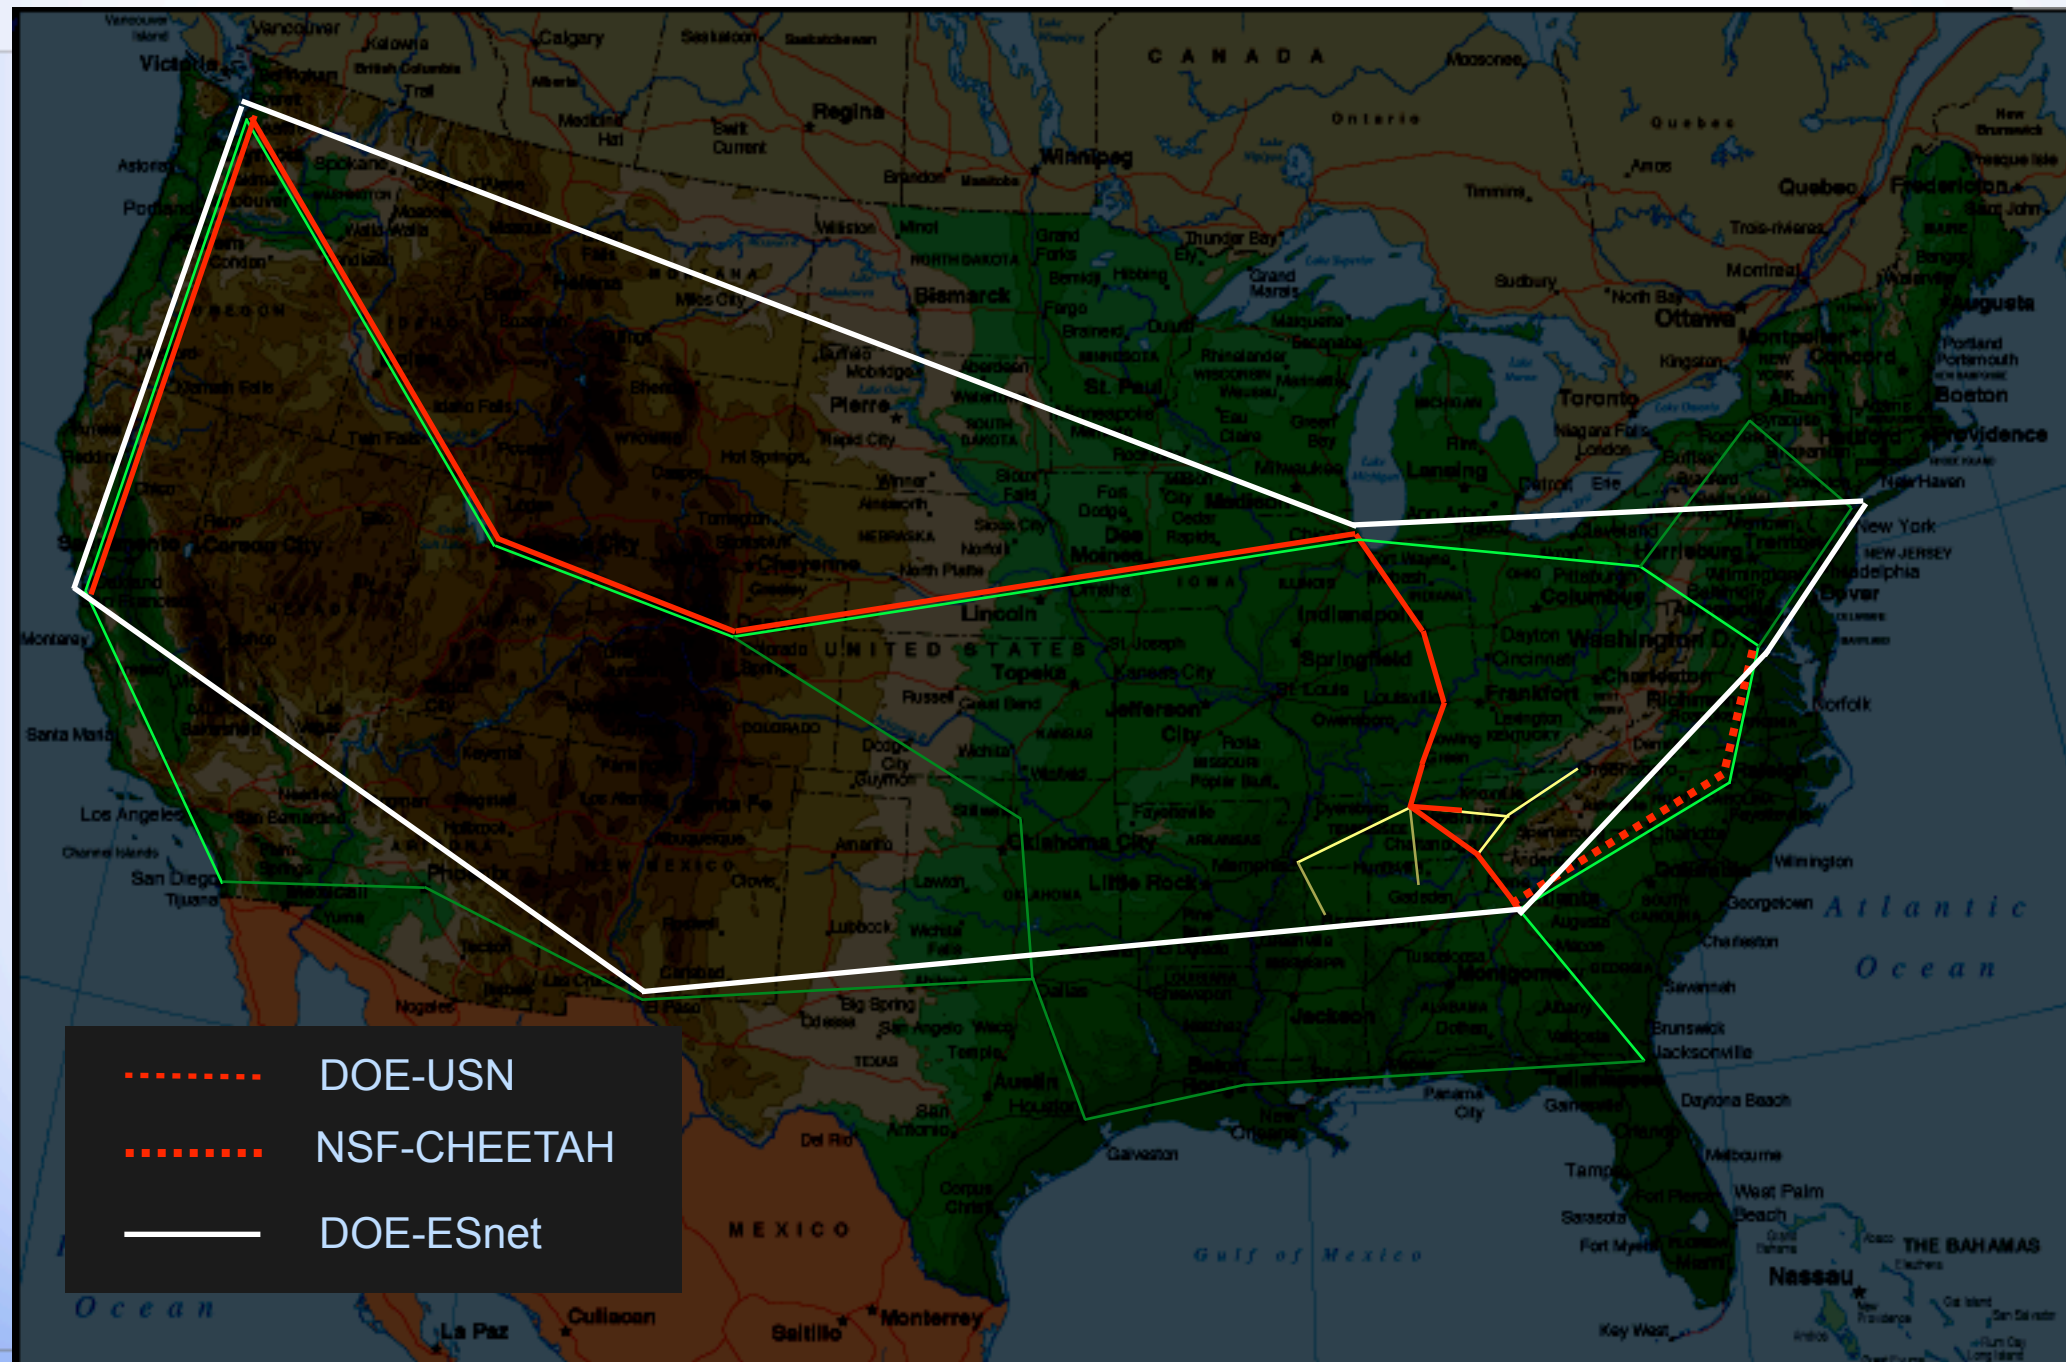

# CHEETAH: an MPLS/GMPLS-based network

# ESnet: DOE's production network (where we will use MPLS tunnels)

# Questions to be answered

- MPLS/GMPLS vs. Scheduling and Reservation
- Inter-domain resource allocation, peering, and brokering
- Transitioning these techniques to operational networks

# MPLS/GMPLS vs Reservation

- Scheduling and reservation come from a supercomputer, batch or grid-using community
- Jobs run for days or weeks, resources scheduled in advance
- File transfer time may only be known approximately
- MPLS comes from the telecom community
  - Pick-up-the-phone-and-dial; it connects, or it doesn't
  - Highly interactive, phone-call like model of computing

# Inter-domain Issues

- UltraScience Net and CHEETAH join in Atlanta
- CHEETAH's western end terminates at ORNL
- Opportunity to experiment with technical, not policy issues
- Policy will have to be settled at or by JET

# Transitioning to Production

- Use “off hours” capacity in ESnet
- Schedule MPLS partial-bandwidth tunnels
- Experiment with scheduling in an operational context
- Fortunately, ESnet is “in the family”

# Current Status

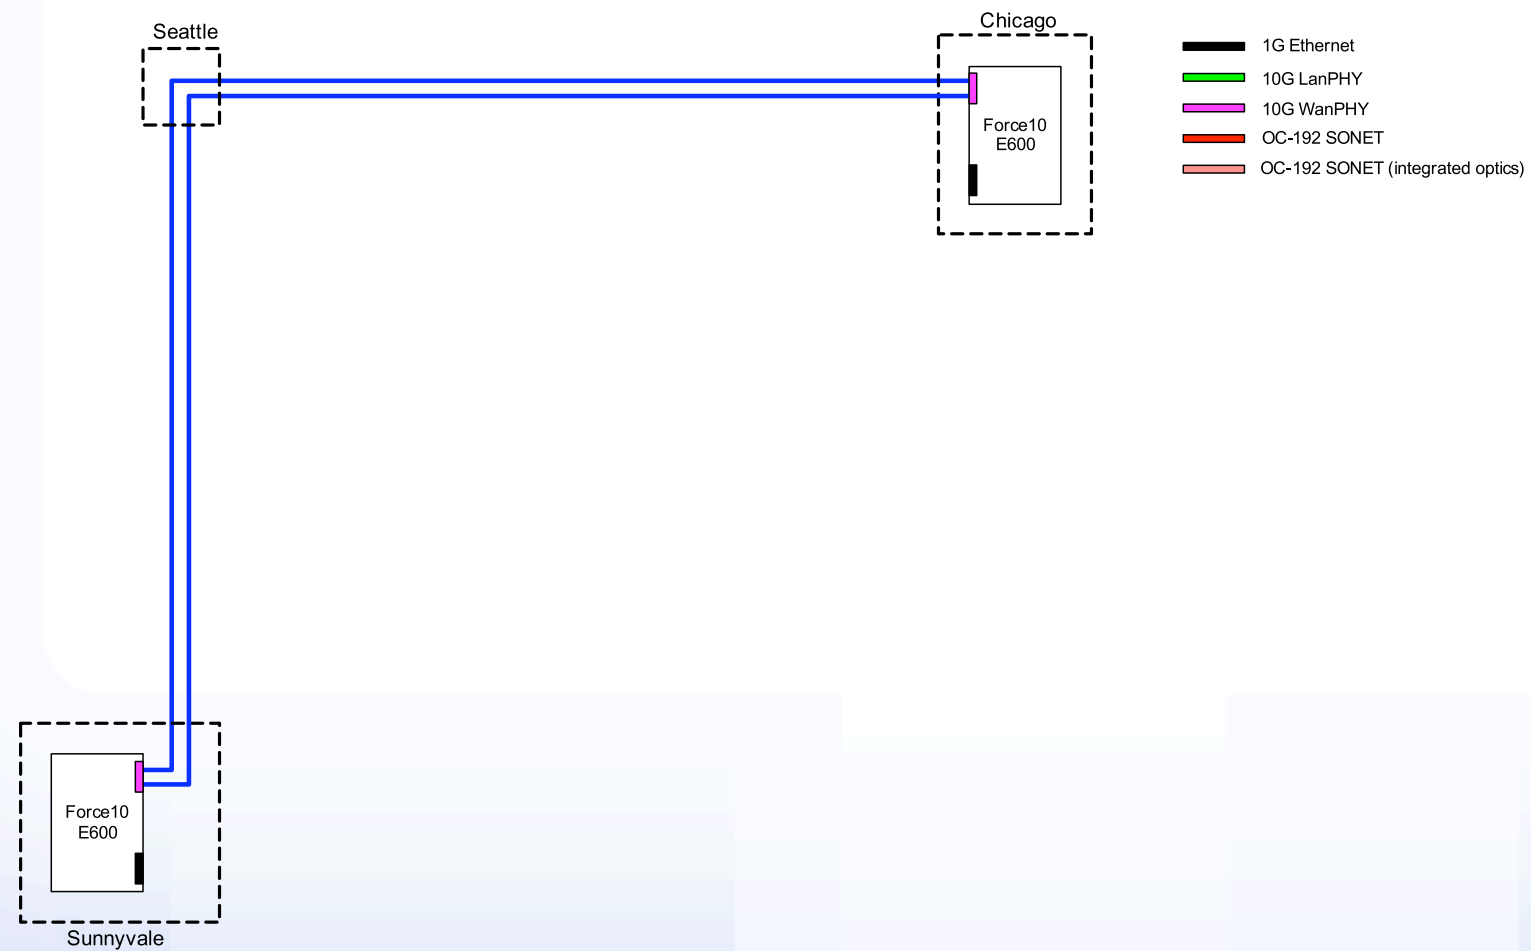

- Chicago Sunnyvale is up and running
- The Atlanta-Chicago circuit is being built out now
  - Most hardware installs are complete, including ORNL
  - All hardware installs scheduled for completion by April 30
  - Test and Turn-up to be complete by mid-May
- Knoxville -Nashville following, roughly one month behind
  - Testing of TVA fiber found some problems...

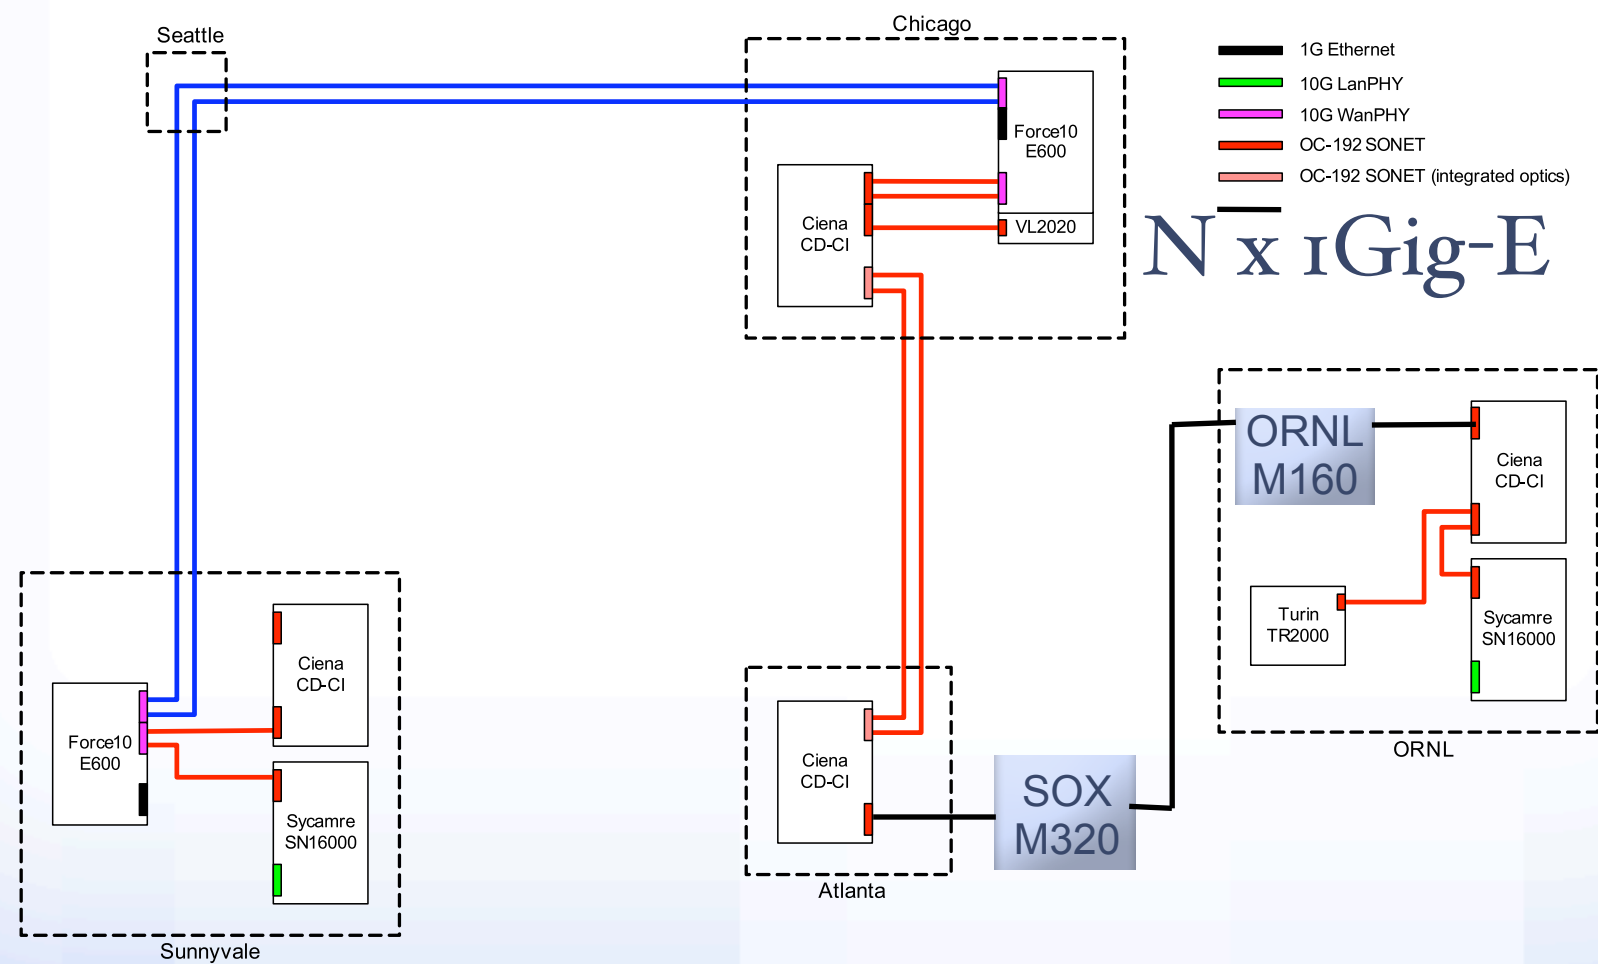

# Chicago-Sunnyvale

- NLR providing 2 x 10Gbs circuits from Chicago to Sunnyvale
  - Initial transport is via 10Gig-Ethernet
  - Circuits up today
- Chicago layer-two switch installed six weeks ago (LAN-PHY)
- Sunnyvale switch installed last week
- Roll to SONET later (May-June?) when NLR brings up SONET lambdas (awaiting Cisco transceivers)

# Phase-I (April)

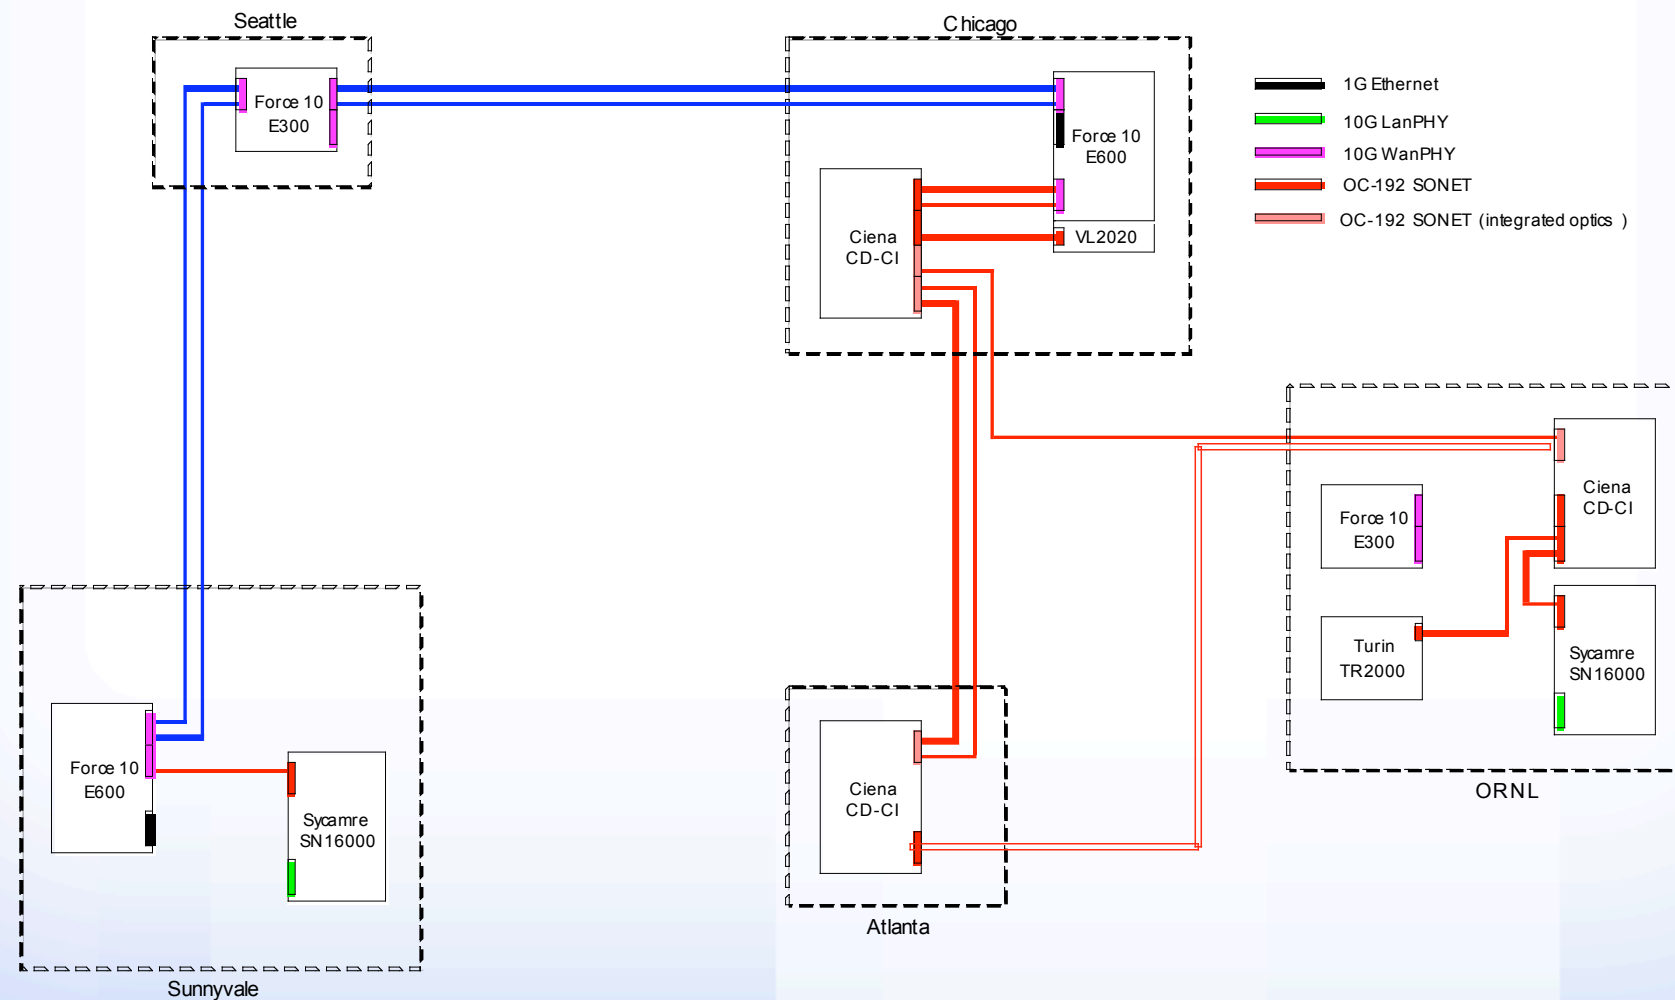

# Phase-2 (April-May)

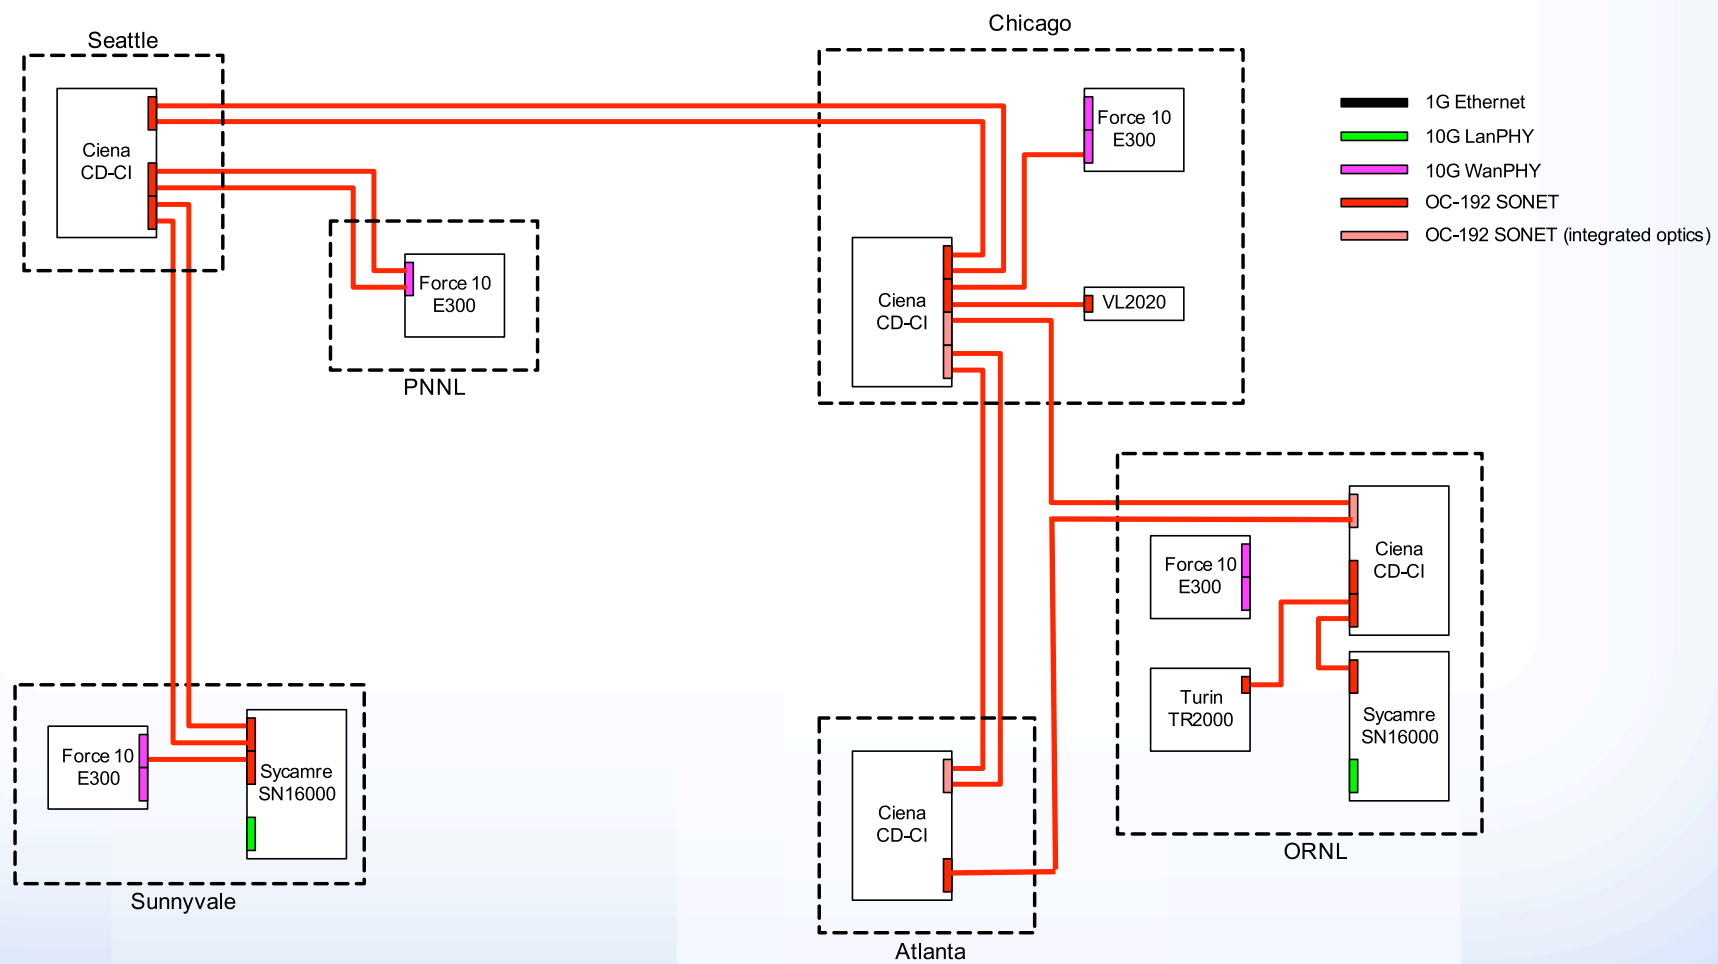

# Phase-3 (May-June)

# Phase-4 (June)

# Thank you
